

Activity Diagrams

Five diagrams covering the processes the Money Exchange System supports: the session that runs the menu, making an exchange, registering a customer, maintaining currencies and rates, and viewing records and reports.

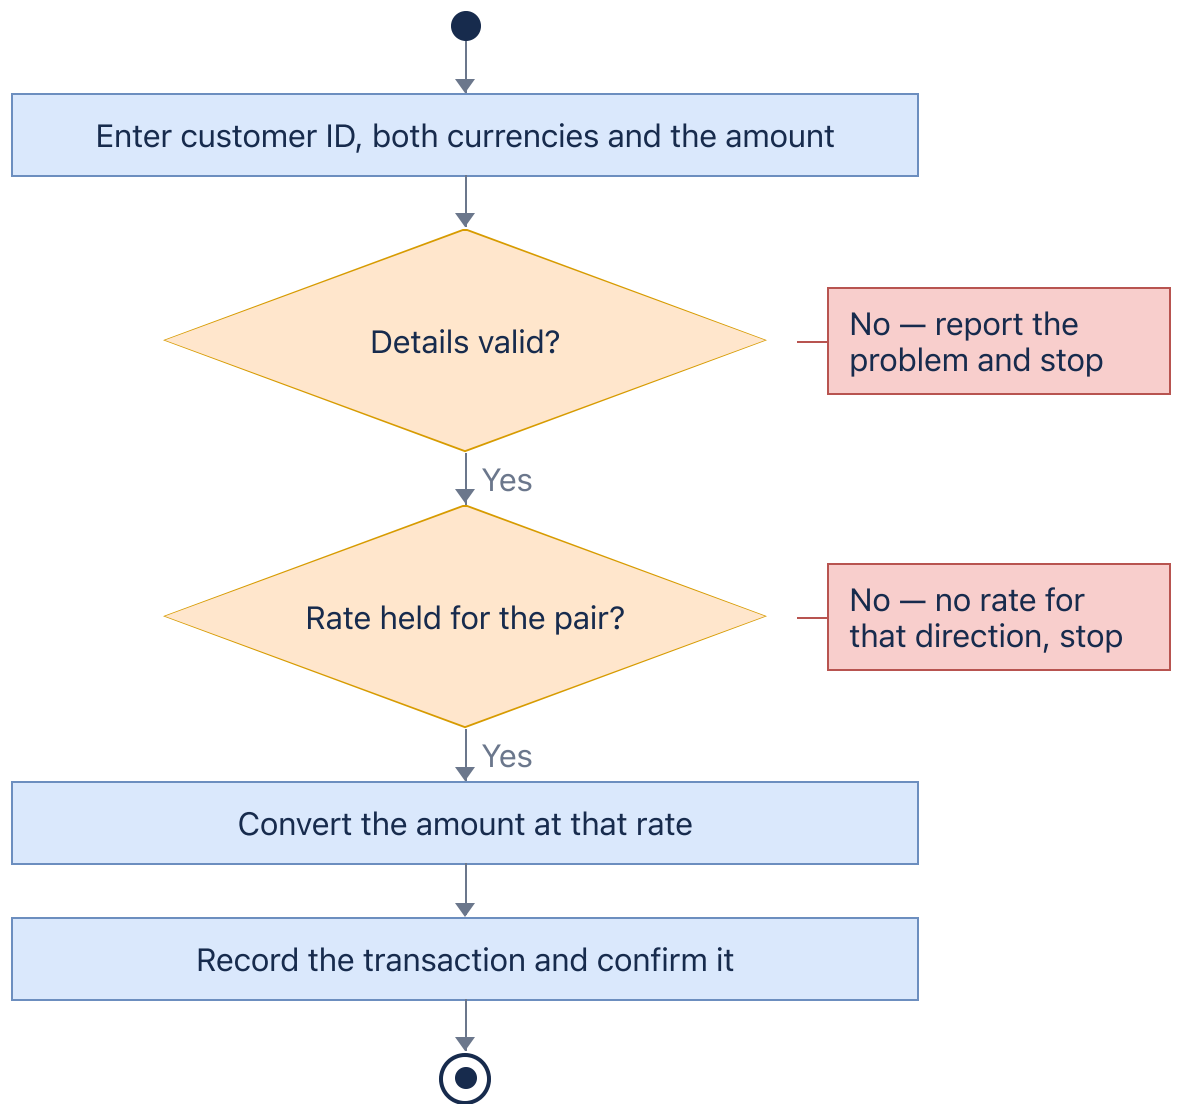

Application session

The database is prepared once, sample data loads only if it is empty, and the menu repeats until the operator exits.

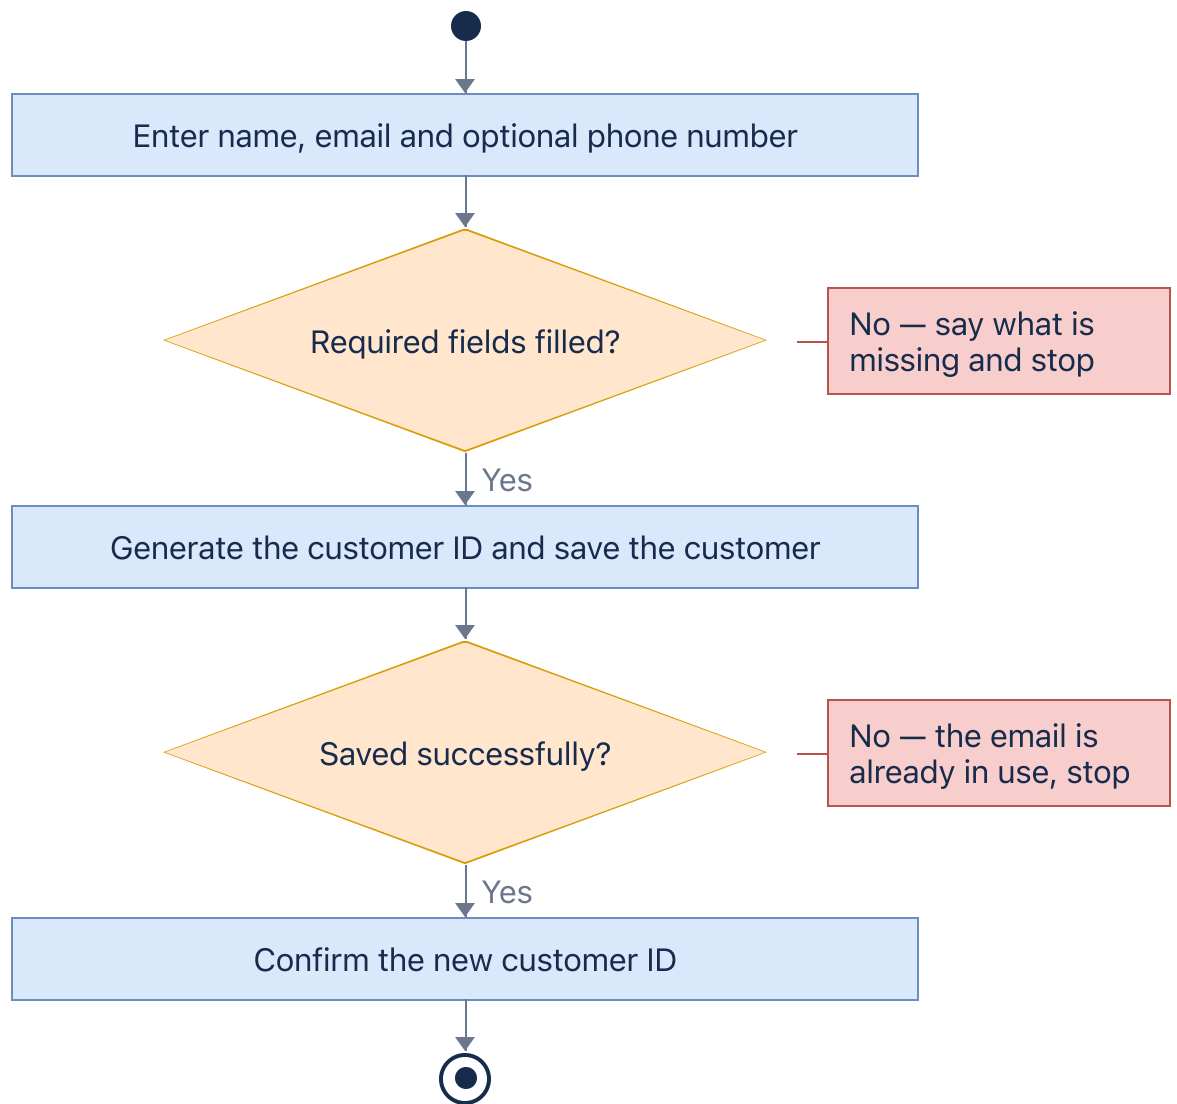

Perform a currency exchange

Inputs are checked before anything is written. The rate in force is copied onto the transaction, so the record stays accurate after rates change.

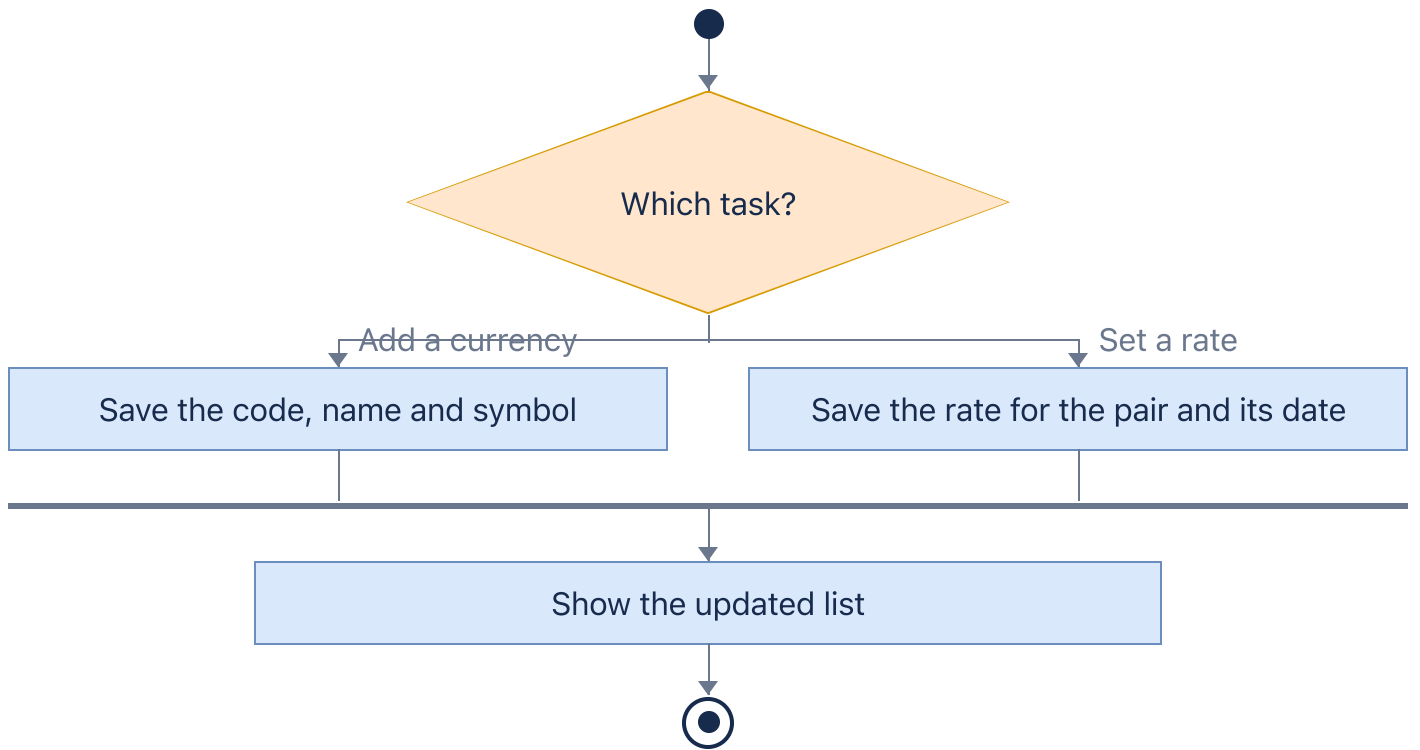

Register a customer

Name and email are required, the phone number is optional. The ID is generated automatically and a duplicate email is rejected by the database.

Maintain currencies and rates

Two reference-data tasks that share a start and a finish. A rate belongs to a direction, and saving a pair that already exists replaces it.

View records and reports

Four listings and two reports share one flow. Only the query differs, and nothing is written.
