

Activity Diagrams

Five diagrams, each split into two swimlanes so it's clear who does what — the person on the left, the system on the right. Every arrow that crosses the middle line is a hand-off between the two.

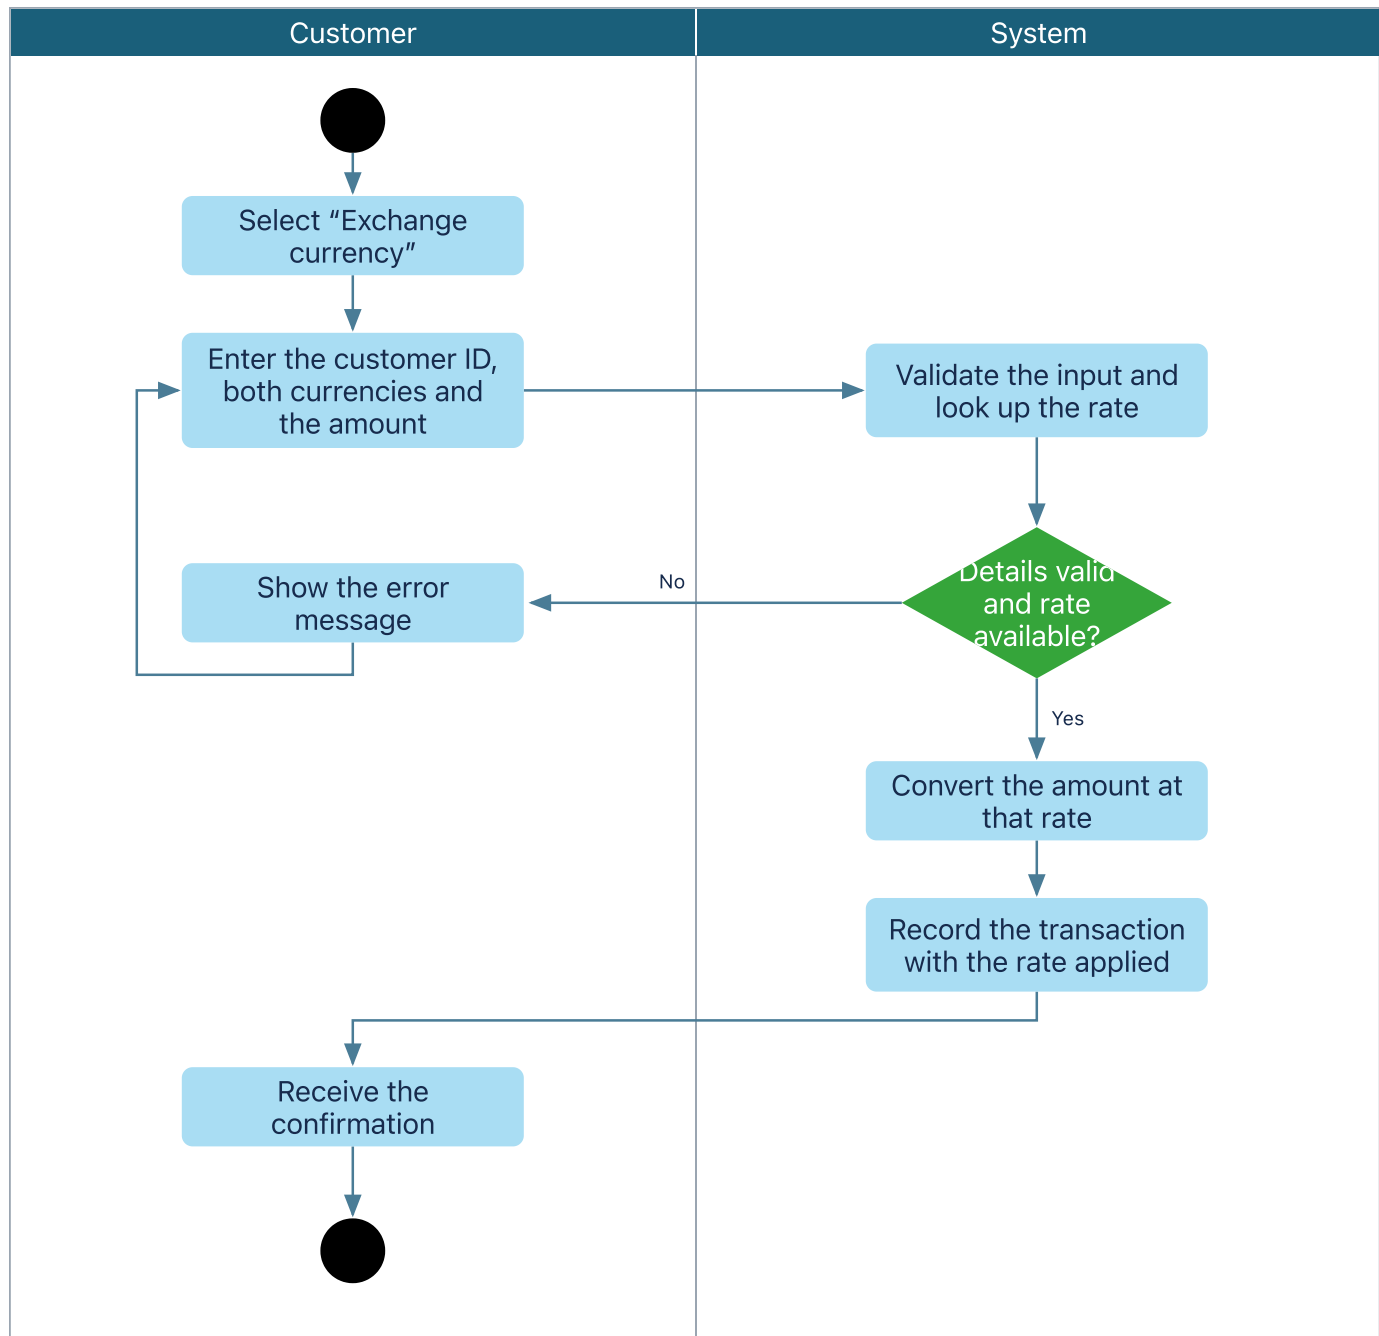

Application session

The database is set up once and sample data only loads if it's empty. After that the menu just keeps coming back until the operator decides to exit.

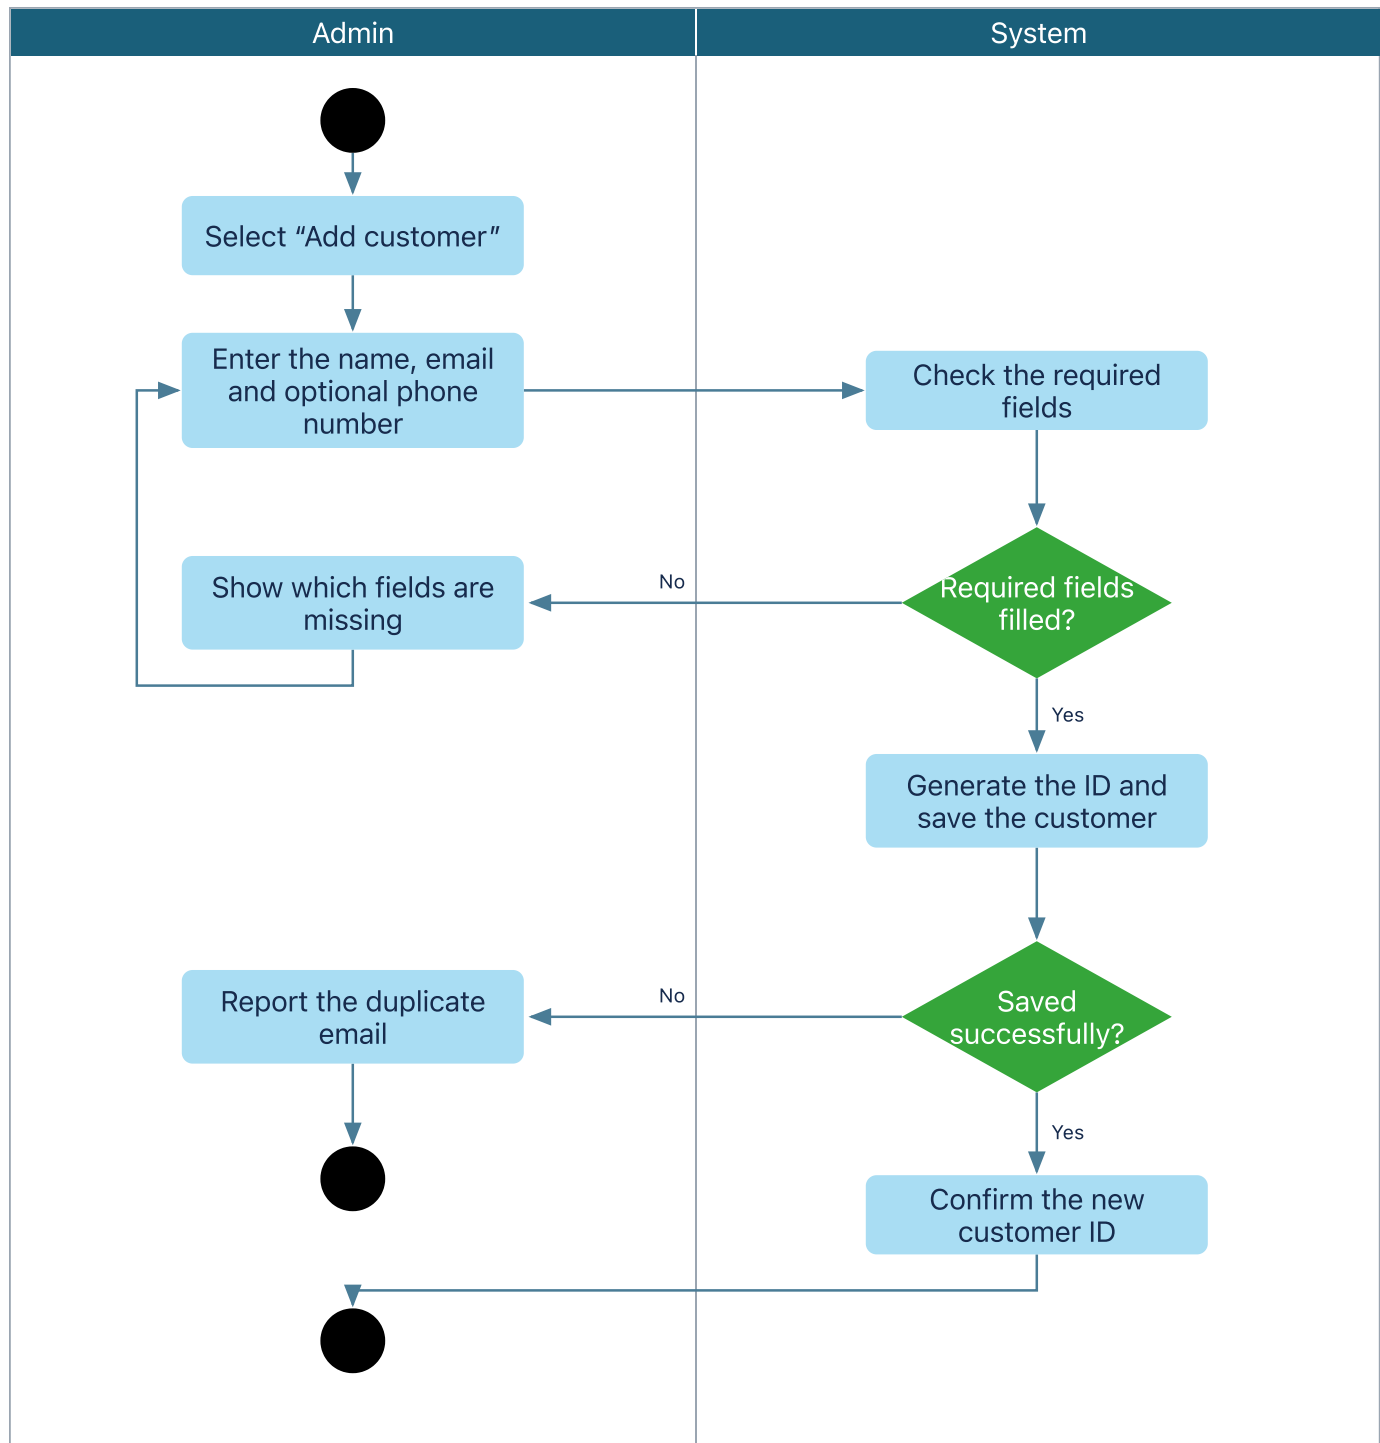

Perform a currency exchange

Everything is checked before anything is written. If something doesn't add up the customer is asked again; once it does, the rate in force is copied onto the transaction so the record still makes sense later.

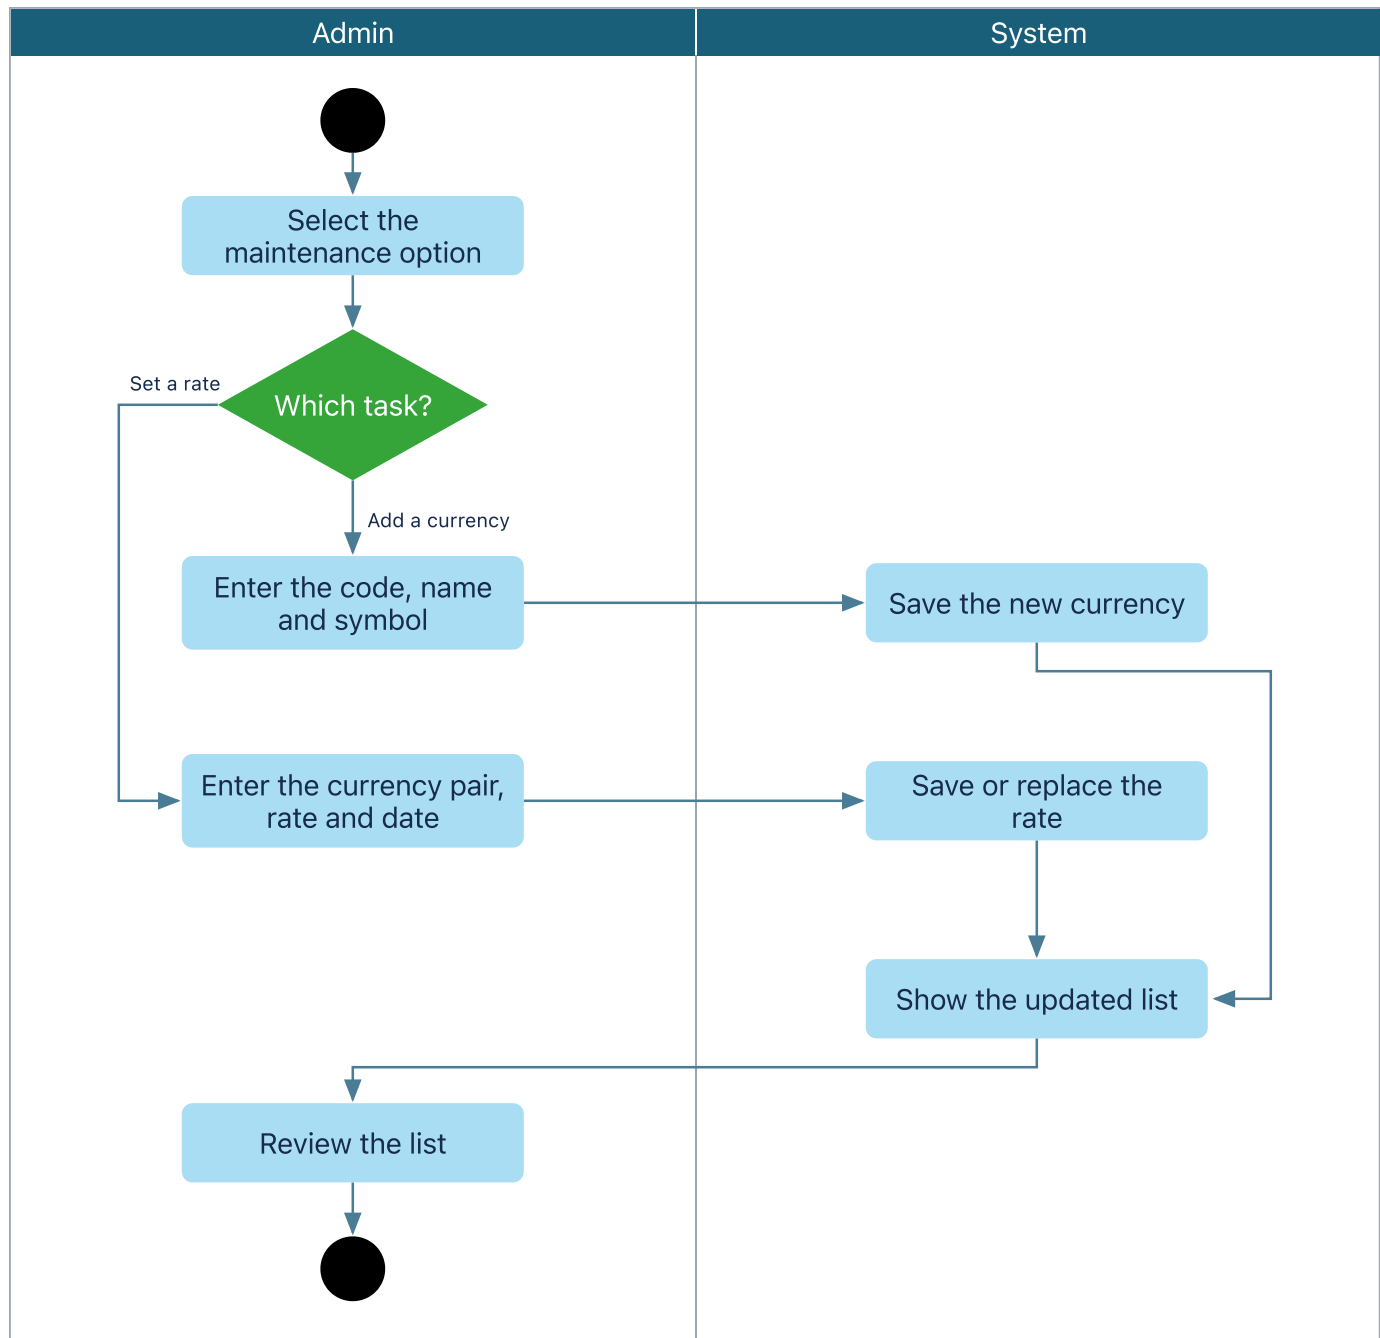

Register a customer

Name and email are required, the phone number is optional. The ID is generated for you, and if the email is already on file the database turns the record away.

Maintain currencies and rates

Two reference-data jobs that start and finish the same way. A rate belongs to a direction, so saving a pair that already exists just replaces it.

View records and reports

Four listings and two reports all follow the same path. Only the query underneath changes, and nothing gets written.
