

Use Case Diagram

Three actors, and each one only sees what belongs to them.

-A student looks at courses and their own enrolments.

-A lecturer looks at the courses they teach and which student is enrolled.

-The administrator keeps the records and runs the two reports the system produces.

Enrolling is the one case with real work behind it, so it pulls in two checks, that the course exists, and that the student is not yet enrolled in it.

The database enforces the second one as well, since a student and a course together form the primary key of an enrolment.
